

Exploratory data analysis-1

```
library(ggplot2)
library(dplyr)
```

```
##
## Attaching package: 'dplyr'
##
## The following objects are masked from 'package:stats':
##
##   filter, lag
##
## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union
```

```
library(stringr)
library(data.table)
```

```
## -----
## data.table + dplyr code now lives in dtplyr.
## Please library(dtplyr)!
## -----
##
## Attaching package: 'data.table'
##
## The following objects are masked from 'package:dplyr':
##
##   between, first, last
```

```
library(reshape2)
```

```
##
## Attaching package: 'reshape2'
##
## The following objects are masked from 'package:data.table':
##
##   dcast, melt
```

Added columns: `genP` full generation probability weighted by VJ usage for our data (aging); `ageing_occur` - number of occurrences in aging dataset, should be normalized by 29,989,055 - total number of rearrangements in aging data.

```
TOTAL_REARRANGEMENTS_AGING = 29989055
```

```
df = read.table("VDJDB_fullP.txt", header=T, sep="\t")
```

```
# Fix issue with SLYNTVATL epitope labelled as CMV in 1555537 -> should put an issue in vjdb-db!
# which is actually HIV
```

```
df$antigen.species = as.factor(ifelse(df$antigen.epitope == "SLYNTVATL", "HIV-1", as.character(df$antigen.species)))
```

```
df$obsP = df$ageing_occur / TOTAL_REARRANGEMENTS_AGING
```

Only intercept (constant) bias is present (from plot):

```
ggplot(df, aes(x=obsP, y=genP)) +
  geom_point(shape=21)+
  geom_smooth(method="lm") +
  geom_abline(slope = 1, intercept = 0, linetype = "dashed", color = "red") +
  scale_x_log10(limits = c(1e-13, 1e-3)) +
  scale_y_log10(limits = c(1e-13, 1e-3)) +
  theme_bw()
```

```
## Warning: Transformation introduced infinite values in continuous x-axis

Summary so far

- There is a difference in both rearrangement prob and selection prob across epitopes
- There is large difference in selection prob across species, no such difference for rearrangement prob
- Difference in selection prob shows that EBV and CMV are favored compared to other species. This can be due to clonal expansions, but: 1) no such difference for Flu 2) we don't account for clonal size, only counting unique rearrangements 3) A02-NLVP is not the top favoured epitope

Features

Epitope len for MHCI

Its more likely to generate TCR recognizing longer epitope, however the observed occurrence frequency is independent of the length of cognate epitope => differences in selection.

```
df.epi = df %>% filter(mhc.class=="MHCI" & genP > 0 & obsP > 0)
df.epi$epi.len = nchar(as.character(df.epi$antigen.epitope))
df.epi.s = df.epi %>%
  group_by(epi.len) %>%
  dplyr::summarise(count = n()) %>%
  arrange(-count)
print(df.epi.s)
```

```

```

Basic CDR3 features

Load annotations produced by VDJdb/Annotate

```
# some dummy stuff
df.ann = read.table("ann.aging_annot_0.txt", header = T, sep = "\t") %>%
```

```
merge(df) %>%
filter(obsP > 0 & genP > 0) %>%
mutate(logOddsSel = log10(obsP) - log10(genP))
```

The only effect comes from length..

```
ggplot(df.ann, aes(x=base.cdr3length / 3, y=logOddsSel)) +
  geom_violin(aes(group = base.cdr3length / 3)) +
  geom_boxplot(aes(group = base.cdr3length / 3), color="red", width=0.2) +
  geom_smooth() +
  theme_bw()
```

```
## `geom_smooth()` using method = 'gam'
```

```
ggplot(df.ann, aes(x=aaprop.strength, y=logOddsSel)) +
  geom_violin(aes(group = aaprop.strength)) +
  geom_boxplot(aes(group = aaprop.strength), color="red", width=0.2) +
  geom_smooth() +
  theme_bw()
```

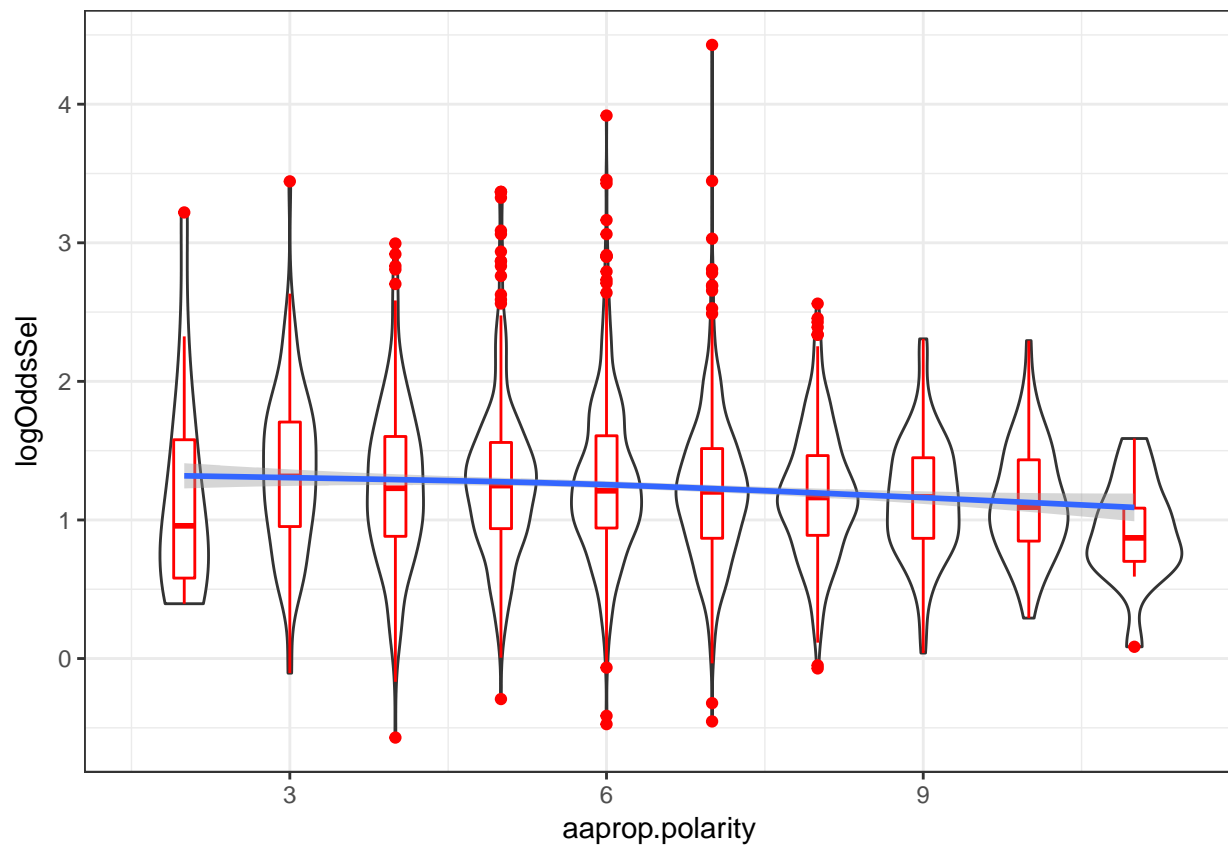

```
## `geom_smooth()` using method = 'gam'
```

```
## Warning: Computation failed in `stat_smooth()`:
## x has insufficient unique values to support 10 knots: reduce k.
```

```
ggplot(df.ann, aes(x=aaprop.polarity, y=logOddsSel)) +
  geom_violin(aes(group = aaprop.polarity)) +
  geom_boxplot(aes(group = aaprop.polarity), color="red", width=0.2) +
  geom_smooth() +
  theme_bw()
```

```
## `geom_smooth()` using method = 'gam'
```

```
ggplot(df.ann, aes(x=aaprop.charge, y=logOddsSel)) +
  geom_violin(aes(group = aaprop.charge)) +
  geom_boxplot(aes(group = aaprop.charge), color="red", width=0.2) +
  geom_smooth() +
  theme_bw()
```

```
## `geom_smooth()` using method = 'gam'
```

```
## Warning: Computation failed in `stat_smooth()`:
```

```
## x has insufficient unique values to support 10 knots: reduce k.
```

```
ggplot(df.ann, aes(x=round(aaprop.hydrophathy), y=logOddsSel)) +
  geom_violin(aes(group = round(aaprop.hydrophathy))) +
  geom_boxplot(aes(group = round(aaprop.hydrophathy)), color="red", width=0.2) +
  geom_smooth() +
  theme_bw()
```

```
## `geom_smooth()` using method = 'gam'
```

Note no effect from the number of strongly-interacting amino acids.

Kidera factor sums for epitope and CDR3

Lets try Kidera factors

```
kidera = t(data.frame(lapply(strsplit("A,-1.56,-1.67,-0.97,-0.27,-0.93,-0.78,-0.2,-0.08,0.21,-0.48;R,0.1",
kidera$Len = 1
kidera = melt(kidera)
```

```
## Using aa as id variables
```

```
make_df = function(cdr3_splt) {  
  data.frame(cdr3 = paste(cdr3_splt, collapse=''), aa=cdr3_splt)  
}
```

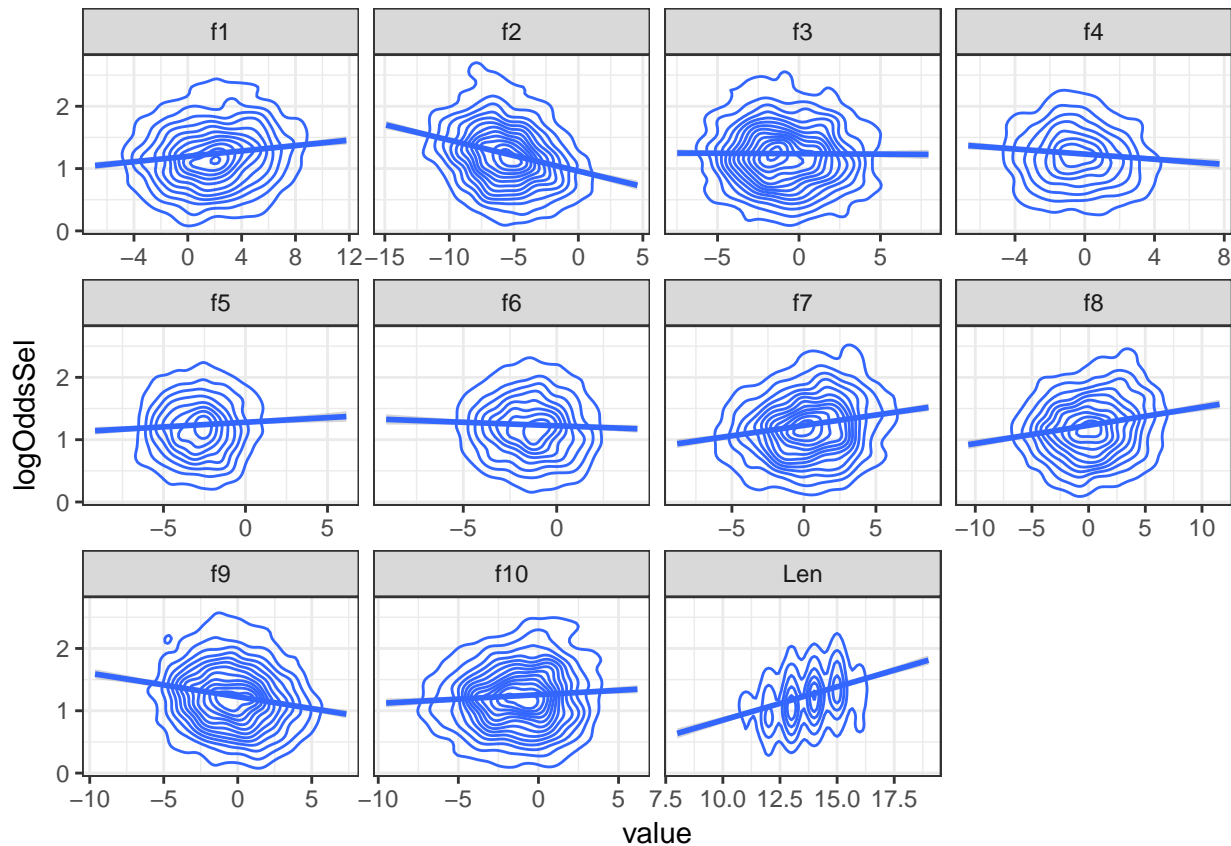

```
df.cdr3.bases = rbindlist(lapply(strsplit(as.character(unique(df$cdr3)), split = ""), make_df))
df.cdr3.bases$aa = as.character(df.cdr3.bases$aa)
df.cdr3.bases = as.data.frame(df.cdr3.bases)
```

```
df.cdr3.kidera = merge(df.cdr3.bases, kidera) %>%
  group_by(cdr3, variable) %>%
  dplyr::summarise(value = sum(value))
```

```
df.cdr3.kidera.1 = merge(df.cdr3.kidera, df %>% dplyr::select(cdr3,
  mhc.class, antigen.epitope, antigen.species, genP, obsP)) %>%
  filter(genP > 0 & obsP > 0)
```

plot and compute correlation

```
df.cdr3.kidera.1$logOddsSel = with(df.cdr3.kidera.1,
                                   log10(obsP/genP))
ggplot(df.cdr3.kidera.1, aes(x=value, y=logOddsSel)) +
  geom_density2d() +
  #geom_point(shape=21, alpha=0.1) +
  geom_smooth(method="lm") +
  facet_wrap(~variable, scales = "free_x") +
  theme_bw()
```

```
for (fac in unique(df.cdr3.kidera.1$variable)) {
  print(fac)
  .df = subset(df.cdr3.kidera.1, variable == fac)
  print(cor.test(.df$logOddsSel,.df$value, method = "spearman"))
}
```

```

```

Further work

Need to annotate Robins data. Check HLA-mediated effect. Can we consistently rule out clonal expansions.. well we can show effect both in CMV+ and CMV- patients for specific clonotypes
